

UArts  ILLUSTRATION

Senior Portfolio 2020

UArts Illustrators are the Imaginers of Society.

They develop their unique visual voice through hands-on training in technique, image making, concept development, marketing and business.

Our curriculum encourages students to dive deep and explore career options that are relevant to their field of interest, from children's books to concept art to product design and beyond. Located within the School of Design, Illustration students work together with students and faculty in adjacent disciplines including Graphic Design, Product Design, Interaction Design, Animation and Fine Arts.

Our small class sizes and supportive faculty create an environment that encourages students to collaborate and inspire each other every day.

This booklet shows some of the incredible work created by our graduating class in 2020.

INSECT ECOSYSTEM

Moths are very important in the Himalayas. There are about 7,000 different moth species living in the Himalayas. They work together to help pollinate the numerous flowers growing there.

Tiger beetles come in many different colors including red, blue, green, and orange. They are very small. But, they are still excellent hunters. They sit around watching from above for the perfect moment to pounce on prey walking by.

Blue Pansy butterflies love sunlight and are often seen basking in the sun. They are colorful and they have eyespots on their wings. The eyespots resemble the eyes of birds which help them intimidate their predators.

The Himalayas are home to an incredibly large amount of diverse species. The region has 10,000 types of plants and 300 types of mammals. Nepal alone is home to 643 species of butterflies. This diversity is due to the many different types of climates throughout the Himalayas. Some of the creatures here, like insects, can live across many of the different climates here.
